Executive Summary — Customer Churn Analysis

The customer churn analysis reveals that approximately **26.5% of customers have churned**, while nearly **73.5% of customers remain retained**, indicating that although the company maintains a strong customer base, a significant portion of users are still leaving the service. The visual analysis shows that churn is heavily concentrated among customers with **Month-to-Month contracts**, indicating lower long-term customer commitment. Customers using **Fiber Optic internet services** demonstrate the highest churn rate compared to DSL and non-internet users, suggesting possible dissatisfaction related to pricing, service quality, or customer expectations. Additionally, customers paying through **Electronic Check** methods exhibit noticeably higher churn behavior than customers using automatic bank transfer or credit card payments.

The analysis further highlights that value-added services play a major role in customer retention. Customers without **Online Security, Tech Support, Device Protection, and Online Backup** services contribute to the majority of churn cases. In several categories, the churn percentage among customers without these support services is nearly double compared to users who subscribe to them. Customers with longer tenure show significantly lower churn rates, while newer customers are more likely to leave within the early stages of their subscription. The charts also indicate that senior citizens experience slightly higher churn rates than non-senior customers. Features such as **Streaming TV, Streaming Movies, Phone Service, and Multiple Lines** show comparatively weaker influence on churn behavior, suggesting that support quality and service reliability are stronger retention drivers than entertainment-based offerings.

Overall, the dashboard and visual analysis clearly indicate that the biggest business risks are associated with:

- Fiber Optic customers
- Month-to-Month contract users
- Customers using Electronic Check payments
- Customers without security and technical support services
- Low-tenure customers

Based on these findings, the company should focus on improving customer onboarding, strengthening technical support quality, promoting bundled security/protection services, and designing retention offers for high-risk customer groups to reduce future churn rates and improve long-term customer loyalty.
